

# Pan-Planets with PANSTARRS1

And : CfA, John Hopkins Uni., UK Consortium, Centr. Uni. Taiwan

# Pan-STARRS

*Panoramic Survey Telescope  
and  
Rapid Response System*

# The renaissance of wide-field imaging

---

- Wide-field imaging (e.g. Palomar, UKST sky surveys) fell into decline with advent of CCDs (high QE, tiny FOV)
- Subsequent decades have seen
  - Exponential growth in area of detectors
  - Matching growth of computer hardware
  - Major investment in image reduction software
- Current state of the art
  - CFHT/Megacam (3.6m/300Mpix)
  - Subaru/Suprime (8m/100Mpix)
  - First optical/near-IR digital surveys complete (SDSS, 2MASS ...)

# Pan-STARRS 1

- 1.8m R-C + corrector (f/4)
- 7 square degree FOV
- 1.4 Gpixel camera
- Sited on Haleakala (Maui)
- 490 square deg/hour
- All sky + deep field surveys in g,r,i,z,y

# Pan-STARRS Deployment Plan

---

- PS1
  - Single telescope to be deployed on Haleakala, Maui
  - To operate from 2007 through 2010
  
- PS4
  - Full-scale system to be deployed ca. 2010
  - To be sited on Mauna Kea
  - ~10 years mission lifetime

# *Haleakala High Altitude Observatory Site*

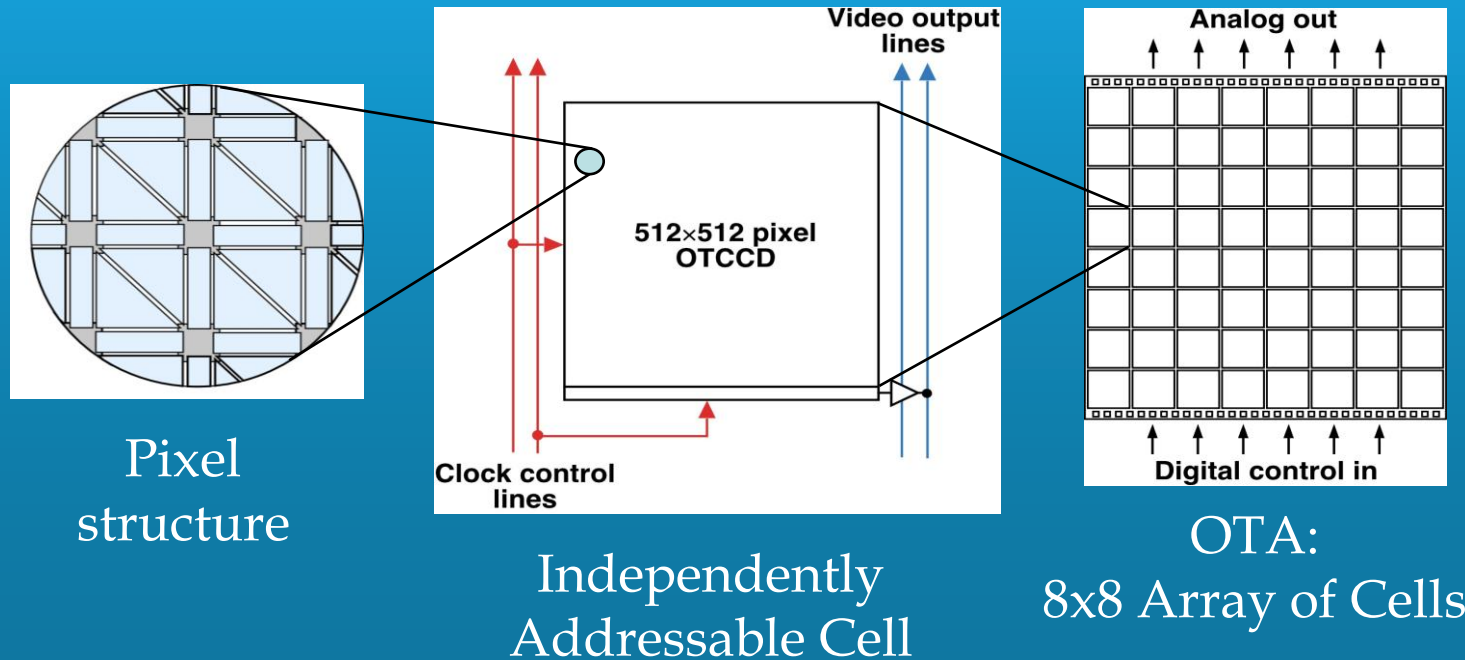

## *The Pan-STARRS 1 Project*

# Detectors: The Orthogonal Transfer Array

- A new paradigm in large imagers.
- Partition a conventional large-area CCD imager into an array of independently addressable CCDs (cells).

64 OTAs in the focal plane of each detector

# OTA Quantum Efficiency

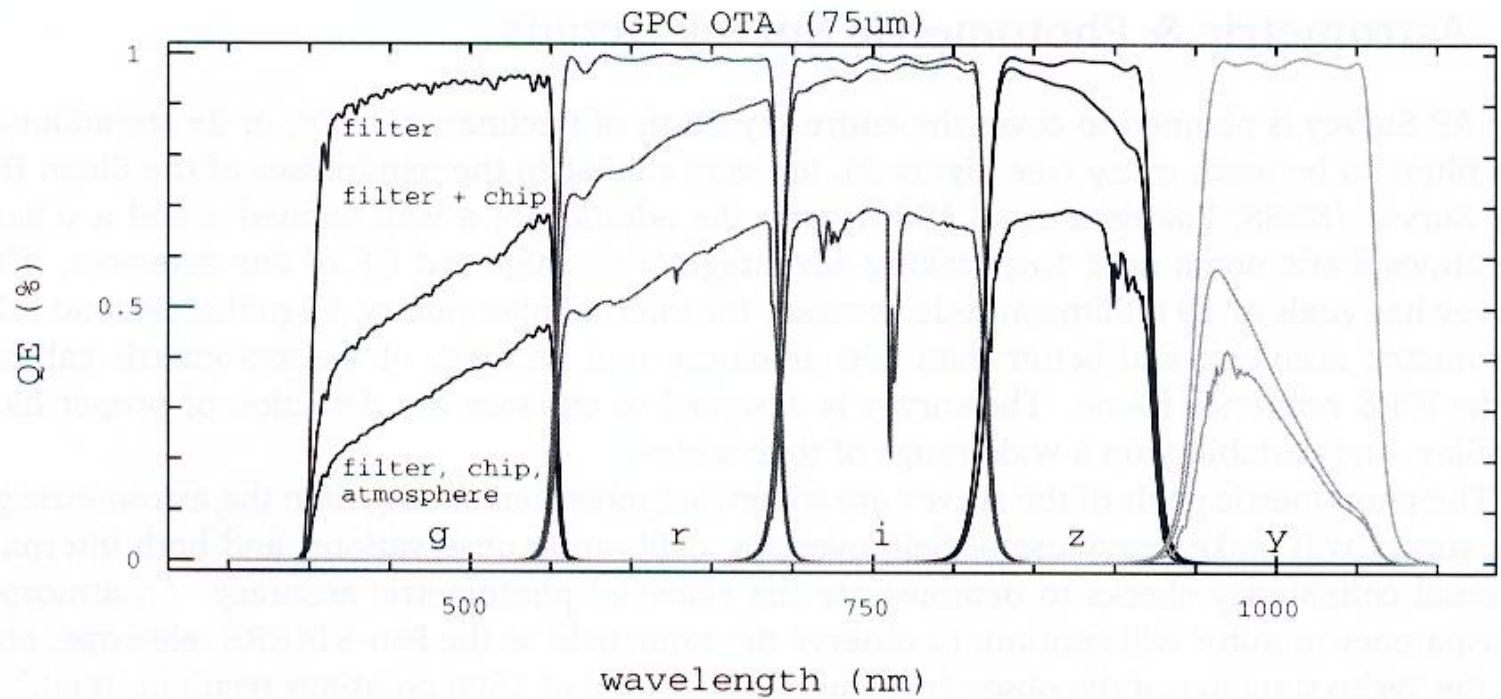

- OTAs demonstrate expected QE (-65°C)

(Megacam)

# Pan-STARRS Bandpasses

# Pan-STARRS overview

- Time domain astronomy
  - Transient objects
  - Moving objects
  - Variable objects
- Static sky science
  - Enabled by stacking repeated scans to form a collection of ultra-deep static sky images

# Scientific Goals

- Inner Solar System Science ( $10^7$  asteroids,  $10^4$  NEO)
- Outer Solar System (Trans Neptunian Objects)
- Stars and the Galaxy  
(Complete stellar census to 100 pc, Best substellar IMF, proper motion of most stars in the MW, merger tidal tails in halo, halo structure, ...)
- Static Sky Cosmology  
(Weak Lensing on very large angular scales (DM distribution), galaxy clustering, ...)
- Cosmology – Type Ia Supernova  
(Dark energy equation of state  $w(z)$ , SF history, SN physics, ...)
- Census of short-time-scale transients  
(gamma-ray bursts, transits, ...)

# A Search for Transiting Extra-Solar Planets with PANSTARRS

## *What is a Planet?*

WORKING GROUP ON EXTRASOLAR PLANETS  
(WGESP) OF THE INTERNATIONAL  
ASTRONOMICAL UNION :

Deuterium Burning Limit: **Objects** with true masses **below** the **limiting mass for thermonuclear fusion of deuterium**, equal to be **13 Jupiter masses** for objects of solar metallicity, **that orbit stars or stellar remnants are "planets"** (no matter how they formed).

# A Search for Transiting Extra-Solar Planets with PANSTARRS

## *Pan-Planets*

**Transit Method** : temporary occultation or transit when the planet passes in front of the parent star causing a drop in its brightness

HST lightcurves of *Tres-1* and *HD209458*  
Brown et al., 2001, 2006

### Transit Observables :

- *Transit depth*  $dF = (R_p/R_*)^2 \rightarrow$  *radius*  $R_p$   
( $dF \sim 1\%$  Jupiter-like planet transiting sun-like star)
- *Period*  $P = (4\pi^2 a^3 / GM_*)^{1/2} \rightarrow$  *orbital radius*  $a$
- *Transit duration*  $(t_{\text{flat}}/t_T)^2 = ([1 - R_p/R_*]^2 - [(D/R_*) \cos i]^2) / ([1 + R_p/R_*]^2 - [(D/R_*) \cos i]^2) \rightarrow$  *inclination angle*  $i$  (if  $R_*$ ,  $M_*$  are known)
- $i + RV \rightarrow$  *planetary mass and density!*

# Results of Transits Surveys - I

Presently 22 transiting extrasolar planets are known (among more than 200 planets):  
 13 Very Hot Jupiters (Periods < 3 days), 9 Hot Jupiters (Periods >= 3 days)

*Originally detected*

## Planet Parameters :

$M_p = 1.3 M_{\text{Jup}}$

$R_p = 1 R_{\text{Jup}}$

Orbital Radius = 0.03 AU

Period = 1.43 days

Inclination = 88 deg

Eccentricity = 0

## Star Parameters :

Spectral Type - K

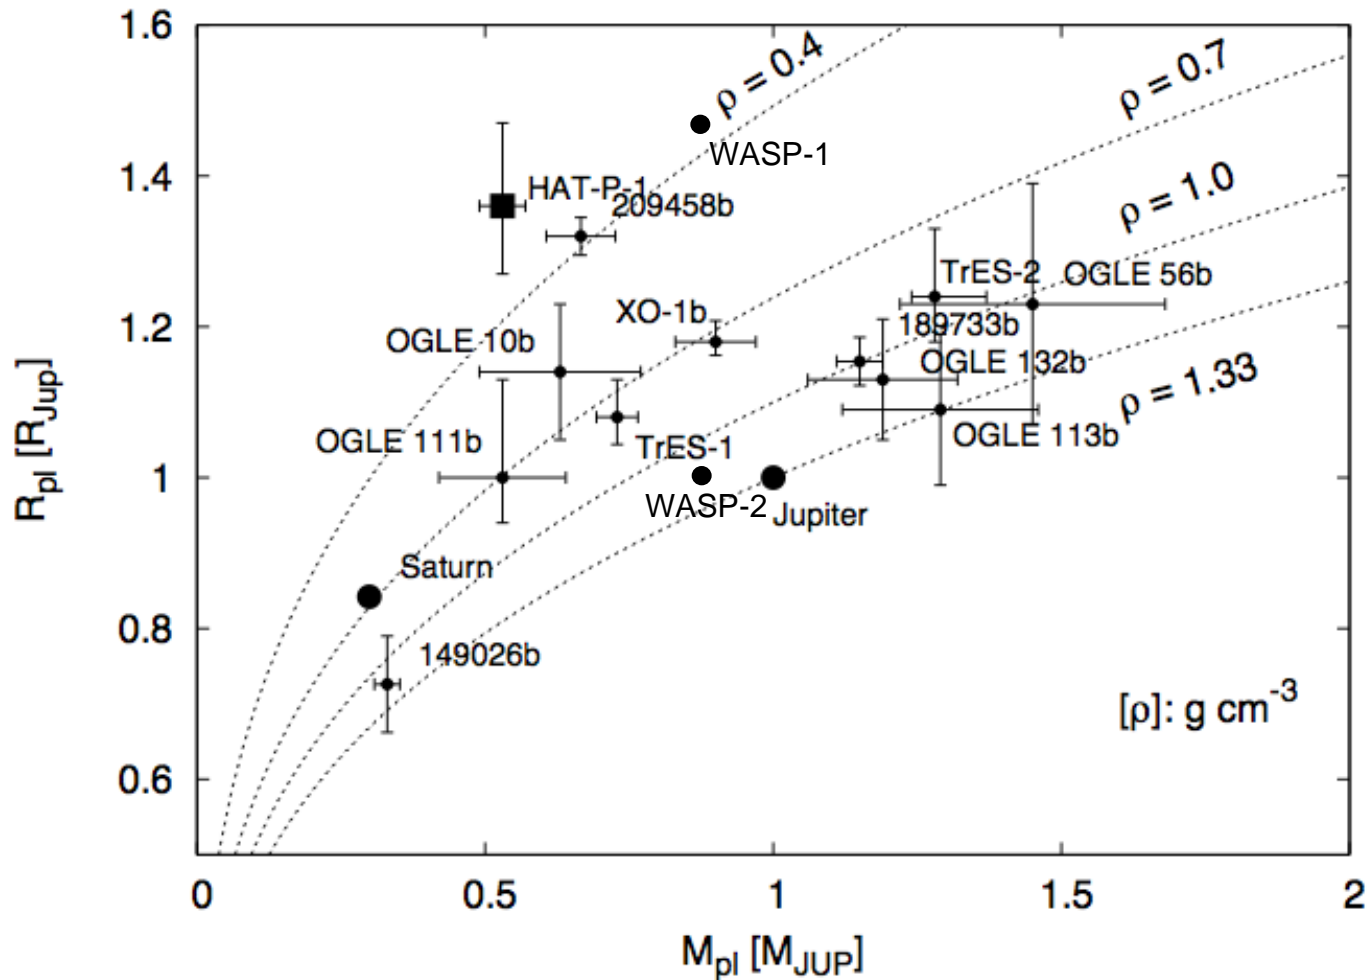

$I = 14.4 \text{ mag}$

$M_{\text{star}} = 0.77 M_{\text{sun}}$

$R_{\text{star}} = 0.78 R_{\text{sun}}$

Limb Darkening Coef. (I) = 0.58

# Results of Transit Surveys - II

# Strength and Weakness of the Transit Method

- Strength:
  - Radius of planet can be inferred from transit depth  $(R_p/R_*)^2$
  - Sensitive to planets in the habitable zone
  - True survey : all stars observed in the same manner
  - Planetary atmospheres
  - Detection of planetary satellites and circumplanetary rings
- Weakness:
  - Orbital plane must be nearly edge-on : geometric probability  $P_g \sim D_*/2a \rightarrow$  0.5% for our Earth.
  - False positives are a major concern:
    - grazing eclipsing binaries
    - transits of small stars in front of a large star
    - blended eclipsing binaries with deep eclipses

# Competitiveness of Pan-Planets in the Current Context

All projects with telescope sizes similar to PS1 have FOV < 0.4 sqdeg.

PS1 has fast read-out (few seconds), and quick telescope slew

# Pan-Planets

## Observing Strategy :

- 180 hours/year equivalent to 30 day campaign/year (6 hours/night)
- 3 hours blocks/night
- 2 targets : in the field and toward an open cluster
- One image every 2 min. allowing to reach  $I=16$ mag  
(and read-out + telescope slewing to next field)
- 3 fields covering  $21 \text{ deg}^2$  with time sampling equal to 6 min.

## Expected Results :

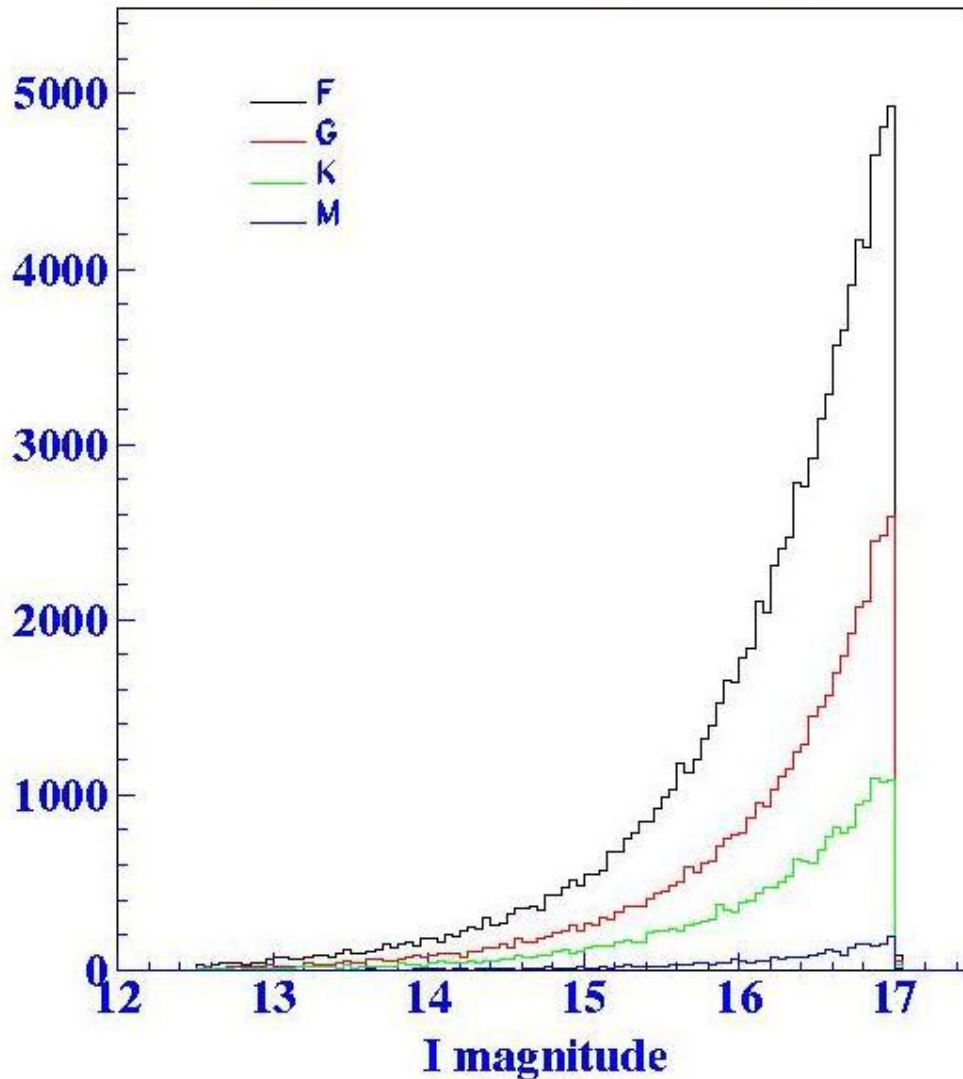

- For a target in the field
  - Besançon Models predict 1.4 million stars with 480,000 dwarfs in 3 fields
  - Assuming photometric precision of 0.3% for  $I=13$  mag to 1% for  $I=16$  mag

Simulations

~ 100 Jupiter-like planets in 3 years !

## I magnitude and spectral type

Besançon Model of the Galaxy :

One field in the Sagitta Constellation

(RA=19h 50m, DEC=17° 04m)

Total number of stars : 564,116

Total number of F,G,K,M dwarfs : 161,394

F dwarfs : 68,914

G dwarfs : 65,261

K dwarfs : 23,226

M dwarfs : 3,993

# Follow-up Strategy of the Candidates

---

## False positives are a major concern:

- grazing eclipsing binaries
  - transits of small stars in front of a large star
  - blended eclipsing binaries with deep eclipses
- **Multi-band and High-Cadence Photometry** for blend identification through color changes and morphological features (ellipsoidal variation)
  - **Low Resolution Spectroscopy** to identify spectral type of stars, constraint the sources size. This allows to rule out giant contaminants, and mass and radius determination of the planets
  - **Medium Resolution Radial Velocity** to select grazing eclipsing binaries. Expected amplitudes are several tens of  $\text{kms}^{-1}$ , whereas hundred  $\text{ms}^{-1}$  for a Jupiter-mass planet around a sun-like star
  - **High-Resolution Radial Velocity** to confirm planetary transits on a sample with minimal contamination.

# Prospects for Pan-STARRS

- PANSTARRS project has an exceptional potential for transit searches due to the combination :
  - large FOV = 7 deg<sup>2</sup>
  - significant telescope size of 1.8m
  - fast read-out of the CCD camera (few seconds)
  - quick slew of the telescope
- These features allow frequent monitoring of several 100,000 stars in only one field, and million of stars in two or more fields!
- PAN-STARRS would devote 30 days per year during 3 years to search for transiting planets, harvesting more than 100 H and VH Jupiter like-planets.
